

The *Technilift*

Our vertical lift 'Technilift' is a reliable and highly recommended method to get both trays and baskets from one floor to another, all while being connected with other linear conveyors. The latest changes allowed us to have a device which functions are very simple yet meets the safety requirements in order to fulfill intensive use with the least maintenance. The flow is regulated by carrying latches to ensure the synchronization with the Technilift. The unloading is done continuously through a link to other ropes and pallets conveyors.

Our realization speak for us.
