

The *Transflex*

The palettes' conveyor is the most efficient way to move heavy items for long distances (with or without curves); it ensures a continuous flow of the ware wash machine's output, hence allows a continuous supply. The Transflex is particularly recommended for:

For the Frontal sorting ware wash concept.

For the baskets' entry or exit of a Technilift.

The semi-lunar shaped acetyl, extremely robust, articulated chain, prevents any jamming thanks to its covering, hence ensuring the employees' safety.

The transflex conveyor has been conceived and designed to allow complete and easy cleaning and maintenance; allowing a perfect hygiene (the chain can be extracted without the use of any tools since there's no tension), and an easy daily cleaning (hose-cleaning, waste wet trough and filtering drawers at each extremity).

Finally, the transflex conveyor can be linked and attached with various types of our other conveyors (Transroll, Technilift, etc.)

Our realization speak for us.
